

SECURITY ASSESSMENT Polymeme Token

April 29, 2026

Audit Status: Pass

RISK ANALYSIS | Polymeme.

■ Classifications of Manual Risk Results

Note: Risk classifications follow CVSS v4.0 standards (<https://www.first.org/cvss/v4.0/specification-document>). Contract security metrics are verified through GoPlus API token scanner technology, which provides real-time validation of contract parameters including honeypot detection, ownership structure, and trading restrictions.

Classification	CVSS Range	Description
 Critical	9.0 - 10.0	Critical vulnerabilities that pose immediate and severe risks requiring urgent attention.
 High	7.0 - 8.9	High-priority issues that could lead to significant security breaches or financial loss.
 Medium	4.0 - 6.9	Medium-severity findings that should be addressed to improve contract security.
 Low	0.1 - 3.9	Low-risk items or best practice suggestions with minimal security impact.
 Informational	0.0	Informational findings about detected functions or contract features.

■ Manual Code Review Risk Results

Contract Security	Description
 Buy Tax	0%
 Sale Tax	0%
 Cannot Buy	Not Detected
 Cannot Sale	Not Detected
 Max Tax	0% (No tax mechanism in contract)
 Modify Tax	No - Contract has no tax setter functions
 Fee Check	Pass
 Is Honeypot?	Not Detected (GoPlus: 0)
 Trading Cooldown	Not Detected
 Enable Trade?	Not Detected

Contract Security	Description
● Pause Transfer?	Not Detected (transfer_pausable: 0)
● Max Tx?	Not Detected
● Is Anti Whale?	Not Detected (is_anti_whale: 0)
● Is Anti Bot?	Not Detected
● Is Blacklist?	Not Detected (is_blacklisted: 0)
● Blacklist Check	Pass
● Is Whitelist?	Not Detected (is_whitelisted: 0)
● Can Mint?	Pass - No Mint Function
● Is Proxy?	Not Detected (is_proxy: 0)
● Can Take Ownership?	Not Detected (can_take_back_ownership: 0)
● Hidden Owner?	Not Detected (hidden_owner: 0)
● Owner	Yes
● Self Destruct?	Not Detected (selfdestruct: 0)
● External Call?	Not Detected (external_call: 0)
i Other?	BEP-20 Standard ERC20 + Ownable on BSC Mainnet
● Holders	3 holders (PinkSale 51.07%, PinkLock V2 40.00%, Team 8.93%)
● Audit Confidence	Low Risk
● Authority Check	N/A - EVM Contract
● Freeze Check	N/A - EVM Contract

This summary provides an overview of identified vulnerabilities and risks. See the full report for detailed methodology and recommendations.

Vulnerability Summary

2
Total Findings

0
Resolved

2
Pending

2
Unresolved

Severity	Resolution Status	Description
0 Critical		Most severe vulnerabilities that can compromise the entire system, leading to complete loss of user funds, unauthorized access, or total system failure.
0 High		Significant vulnerabilities that can cause substantial harm, financial losses, data breaches, or denial of service attacks.
1 Medium	0 Resolved, 1 Pending	Moderate security risks that may not have immediate impact but could lead to exploitation if left unaddressed.
1 Low	0 Resolved, 1 Pending	Minor issues with minimal security impact; recommended to address for maintaining robust security posture.
0 Informational		Non-critical observations providing suggestions for code optimizations, best practices, or documentation improvements.

Industry Standards Compliance

This audit follows internationally recognized security standards to provide comprehensive assurance.

Token Distribution

PinkSale Presale Escrow

Held by PinkSale presale contract 0x1AD6B19503B808f f70db5918b3666848DABE44 C5 for public sale (510,668,000 \$POME).

51.07%

PinkLock V2 (Team / Vesting)

Locked in PinkLock V2 0x4079 93575c91Ce7643a4d4ccAcC9 A98c36ee1Bbe across three tranches (100M + 200M + 100M = 400,000,000 \$POME).

40%

Team / Treasury Wallet

Held by team wallet 0x1782d25 d1f5b26a9da38f8d373e12d5e2 8772CaF (89,332,000 \$POME) for marketing, partnerships, and operational use.

8.93%

PancakeSwap Liquidity (Planned)

No DEX liquidity yet - PancakeSwap LP will be added post-presale per PinkSale launchpad terms.

Transaction simulation conducted using Tenderly API to verify contract functionality on mainnet state. Tests include standard ERC20 operations and contract-specific functions. Results indicate operational status and gas efficiency. This testing supplements the comprehensive security assessment above.

Call Graph

The Smart Contract Graph is a visual representation of the interconnectedness and relationships between smart contracts within a blockchain network. It provides a comprehensive view of the interactions and dependencies between different smart contracts, allowing developers and users to analyze and understand the flow of data and transactions within the network. The Smart Contract Graph enables better transparency, security, and efficiency in decentralized applications by facilitating the identification of potential vulnerabilities, optimizing contract execution, and enhancing overall network performance.

Inheritance Check

Smart contract inheritance is a concept in blockchain programming where one smart contract can inherit properties and functionalities from another existing smart contract. This allows for code reuse and modularity, making the development process more efficient and scalable. Inheritance enables the child contract to access and utilize the variables, functions, and modifiers defined in the parent contract, thereby inheriting its behavior and characteristics. This feature is particularly useful in complex decentralized applications (dApps) where multiple contracts need to interact and share common functionalities. By leveraging smart contract inheritance, developers can create more organized and maintainable code structures, promoting code reusability and reducing redundancy.

TECHNICAL FINDINGS

Smart contract security audits classify risks into several categories: Critical, High, Medium, Low, and Informational. These classifications help assess the severity and potential impact of vulnerabilities found in smart contracts.

Classification of Risk

Severity	CVSS Range	Description
 Critical	9.0 - 10.0	Immediate danger. Exploitable vulnerabilities that could lead to fund loss, unauthorized access, or complete system compromise.
 High	7.0 - 8.9	Significant security risk. Vulnerabilities that should be addressed urgently to prevent potential exploitation.
 Medium	4.0 - 6.9	Moderate security risk. Issues that could lead to security problems if combined with other vulnerabilities.
 Low	0.1 - 3.9	Minor security concern. Best practice violations or low-impact issues.
 Informational	0.0	Code quality or optimization suggestions with no direct security impact.

FINDINGS

In this document, we present the findings and results of the smart contract security audit. The identified vulnerabilities, weaknesses, and potential risks are outlined, along with recommendations for mitigating these issues. It is crucial for the team to address these findings promptly to enhance the security and trustworthiness of the smart contract code.

Severity	Found	Pending	Resolved
 Critical	0	0	0
 High	0	0	0
 Medium	1	1	0
 Low	1	1	0
 Informational	0	0	0
Total	2	2	0

In a smart contract, a technical finding summary refers to a compilation of identified issues or vulnerabilities discovered during a security audit. These findings can range from coding errors and logical flaws to potential security risks. It is crucial for the project owner to thoroughly review each identified item and take necessary actions to resolve them. By carefully examining the technical finding summary, the project owner can gain insights into the weaknesses or potential threats present in the smart contract. They should prioritize addressing these issues promptly to mitigate any risks associated with the contract's security. Neglecting to address any identified item in the security audit can expose the smart contract to significant risks. Unresolved vulnerabilities can be exploited by malicious actors, potentially leading to financial losses, data breaches, or other detrimental consequences. To ensure the integrity and security of the smart contract, the project owner should engage in a comprehensive review process. This involves understanding the nature and severity of each identified item, consulting with experts if needed, and implementing appropriate fixes or enhancements. Regularly updating and maintaining the smart contract's codebase is also essential to address any emerging security concerns. By diligently reviewing and resolving all identified items in the technical finding summary, the project owner can significantly reduce the risks associated with the smart contract and enhance its overall security posture.

SOCIAL MEDIA CHECKS | Polymeme.

From a security assessment standpoint, inspecting a project's social media presence is essential. It enables the evaluation of the project's reputation, credibility, and trustworthiness within the community. By analyzing the content shared, engagement levels, and the response to any security-related incidents, one can assess the project's commitment to security practices and its ability to handle potential threats.

Social Media Information Notes:

Auditor Notes: All four primary social channels (website, Twitter/X, Telegram, Medium) verified live and consistent. Website transparently displays the contract address with copy/BscScan links and PinkSale presale link.

Project Owner Notes: Multi-channel community presence with on-platform support contacts.

Assessment Results

Final Audit Score \$POME.

Review	Score
Security Score	97
Auditor Score	97

Our security assessment or audit score system for the smart contract and project follows a comprehensive evaluation process to ensure the highest level of security. The system assigns a score based on various security parameters and benchmarks, with a passing score set at 80 out of a total attainable score of 100. The assessment process includes a thorough review of the smart contracts codebase, architecture, and design principles. It examines potential vulnerabilities, such as code bugs, logical flaws, and potential attack vectors. The evaluation also considers the adherence to best practices and industry standards for secure coding. Additionally, the system assesses the projects overall security measures, including infrastructure security, data protection, and access controls. It evaluates the implementation of encryption, authentication mechanisms, and secure communication protocols. To achieve a passing score, the smart contract and project must attain a minimum of 80 points out of the total attainable score of 100. This ensures that the system has undergone a rigorous security assessment and meets the required standards for secure operation.

Important Notes for \$POME

Polymeme (\$POME) Token Audit Report

Contract Type: BEP-20 (ERC20 + Ownable, OpenZeppelin StandardToken)

Platform: BNB Smart Chain (BSC Mainnet, Chain 56)

Compiler Version: Solidity 0.8.4 (optimized, 200 runs)

Audit Date: 2026-04-29

Contract Overview:

Polymeme is a prediction-market platform on Solana and BSC offering pari-mutuel pools settled on-chain in USDT. The \$POME token is a BEP-20 utility token deployed via a token-generator factory using a standard OpenZeppelin ERC20 + Ownable pattern. The contract is bytecode-matched on BscScan to a verified reference (StandardToken). Fixed total supply of 1,000,000,000 \$POME, currently in PinkSale pre-sale phase.

Security Classification:

Audit Score: 97/100 (PASS)

Confidence Level: Low Risk

Centralization Risk: Low (owner can only transferOwnership / renounceOwnership)

Summary of Findings:

Total Issues: 2 (0 Critical, 0 High, 1 Medium, 1 Low, 0 Info)

Failed: CFG10 (Low), CFG12 (Medium)

Passed: CFG02, CFG03, CFG05, CFG06, CFG07, CFG08, CFG09, CFG11, CFG13, CFG14,

CFG15, CFG16, CFG18, CFG20, CFG21, CFG22, CFG23, CFG24, CFG25, CFG26

Not Applicable: CFG01, CFG04, CFG17, CFG19

Critical & High Severity Findings:

None.

Medium Severity Findings:

CFG12 - Ownership Not Yet Renounced

The owner address (0xD4Ed045E9f867f7B926dd6A204B99220dc097b5C) has not yet renounced ownership. Privilege surface is limited to transferOwnership() and renounceOwnership() - the owner cannot mint, pause, tax, blacklist, or seize tokens. After PancakeSwap LP is added and locked, either renounce ownership or transfer to a multisig (e.g., Gnosis Safe).

Low Severity Findings:

CFG10 - Initial 100% Mint to Deployer

The constructor mints the entire 1B supply to the deployer wallet, which is standard for

token-generator deployments. The deployer has already distributed 510.67M to the PinkSale presale contract, 400M to PinkLock V2 (three vesting tranches: 100M + 200M + 100M), and retains 89.33M in the team wallet. Recommend disclosing the team allocation on the tokenomics page and optionally locking the team tokens via PinkLock as well.

Token Security Summary (GoPlus Token Security API):

is_honeypot: 0 (Not Detected)
 is_mintable: 0 (No mint function)
 is_proxy: 0 (Not upgradeable)
 is_blacklisted: 0 (No blacklist)
 transfer_pausable: 0 (Cannot be paused)
 selfdestruct: 0 (No selfdestruct)
 external_call: 0 (No external calls)
 slippage_modifiable: 0 (No tax modification)
 hidden_owner: 0 (No hidden owner)
 can_take_back_ownership: 0 (Ownership transfer one-way)
 anti_whale_modifiable: 0 (No max-tx modification)
 cannot_buy: 0 (Buying not blocked)
 buy_tax: 0% / sell_tax: 0% / transfer_tax: 0%

Token Distribution (3 holders, on-chain verified):

PinkSale Presale Escrow: 510,668,000 (51.07%) - 0x1AD6B19503B808ff70db5918b3666848DABE44C5
 PinkLock V2 (Locked): 400,000,000 (40.00%) - 0x407993575c91Ce7643a4d4ccAcC9A98c36ee1Bbe
 Team Treasury Wallet: 89,332,000 (8.93%) - 0x1782d25d1f5b26a9da38f8d373e12d5e28772CaF

Immediate Actions Recommended:

- Renounce ownership or transfer to a multisig after PancakeSwap LP is added and locked.
- Lock the PancakeSwap LP tokens for at least 12 months via PinkLock or Mudra Locker.
- Publish the PinkLock public lock URLs on the website tokenomics page so investors can independently verify the lock terms (quantity, unlock date, beneficiary).
- Optionally lock the 89.33M team-treasury allocation via PinkLock.
- Submit the token logo and metadata to BscScan for verified token-info display.

Recommendations:

The contract surface is minimal and follows industry best practice. The remaining risks are operational rather than code-level: ensure the PancakeSwap LP is locked, the owner ownership is renounced (or moved to a multisig), and that the team wallet allocation is transparently documented. Pre-sale participants should independently verify the PinkSale

launchpad terms and PinkLock vesting schedules via the public dashboards.

Timeline Estimate: Operational recommendations can be implemented within 1-2 weeks (post-presale, around the PancakeSwap launch event).

CFGNinja Security has reviewed the deployed Polymeme (\$POME) contract and finds it suitable for pre-sale and post-launch use, subject to the operational recommendations above being implemented around the PancakeSwap launch.

I Appendix

Finding Categories

Centralization / Privilege

Centralization / Privilege findings refer to either feature logic or implementation of components that act against the nature of decentralization, such as explicit ownership or specialized access roles in combination with a mechanism to relocate funds.

Gas Optimization

Gas Optimization findings do not affect the functionality of the code but generate different, more optimal EVM opcodes resulting in a reduction in the total gas cost of a transaction.

Logical Issue

Logical Issue findings detail a fault in the logic of the linked code, such as an incorrect notion of how `block.timestamp` works.

Control Flow

Control Flow findings concern the access control imposed on functions, such as owner-only functions being invocable by anyone under certain circumstances.

Volatile Code

Volatile Code findings refer to segments of code that behave unexpectedly in certain edge cases that may result in a vulnerability.

Coding Style

Coding Style findings usually do not affect the generated byte-code but rather comment on how to make the codebase more legible and, as a result, easily maintainable.

Inconsistency

Inconsistency findings refer to functions that should seemingly behave similarly yet contain different code, such as a constructor assignment imposing different require statements on the input variables than a setter function.

Coding Best Practices

ERC 20 Coding Standards are a set of rules that each developer should follow to ensure the code meets a set of criteria and is readable by all developers.

Disclaimer

Scope. This report documents the results of a security assessment and smart contract audit performed by Bladepool / CFG NINJA (the "Auditor") for the project specified in this report. The assessment covers only the deliverables and code expressly listed in the engagement; any changes, integrations, or subsequent deployments are outside the scope.

No Warranty. The Auditor performs the assessment using industry-standard practices but makes no representations or warranties, express or implied, including any warranty of merchantability, fitness for a particular purpose, or non-infringement. The Auditor does not guarantee that the audited code is free of bugs, vulnerabilities, or exploitable issues.

Limitation of Liability. To the maximum extent permitted by law, the Auditor and its affiliates, officers, employees, agents, and contractors shall not be liable for any indirect, incidental, special, consequential, or punitive damages, or for any loss of profits, revenue, data, or business opportunities, arising out of or related to the assessment, even if advised of the possibility of such damages. The Auditor's aggregate liability for direct damages is limited to the fees paid for the audit engagement.

Client Responsibility. The project owner/client retains sole responsibility for all decisions and actions taken in connection with the audited code, including fixing identified issues, deploying code to any environment, and applying security mitigations. The Auditor's recommendations are advisory; implementation and verification of fixes are the client's responsibility.

Third-Party Tools and Services. The Auditor may use third-party tools, services, or automated scanners as part of the assessment. Use of such tools is without warranty; the Auditor is not responsible for defects, failures, or inaccuracies arising from third-party services.

Confidentiality and Data Security. The Auditor will treat non-public client information as confidential. However, the Auditor cannot guarantee absolute security for data transmitted over the internet or third-party platforms. Client should take reasonable precautions to protect sensitive information.

Not Financial, Legal, or Investment Advice. The assessment is a technical security review only and is not financial, legal, tax, or investment advice. Clients should consult appropriate professionals for those matters.

Ownership and Governance Notes. If ownership is transferred, held by a multisig, or controlled by a governance contract, the client should document and disclose those arrangements; the Auditor's report reflects the ownership state observed during the engagement but may not reflect subsequent changes.

Governing Law and Counsel. This engagement and any disputes arising from it shall be governed by the laws agreed in the engagement terms. Clients are advised to seek legal counsel before relying on or publishing the report.

Acceptance. By proceeding with this engagement or using this report, the client acknowledges and accepts these terms.
